
A
Timing: reach (colour) vs rest (grey)
fraction in the 200 ms before peak velocity
1.00
0.75
0.50
0.25
0.00
field term, pairwise
field term, independent
polarization index
mean rate
decoder (given target)
B
Precision (lower is better)
distance of minimum from peak acceleration (ms)
600
400
200
0
field term, pairwise
field term, independent
polarization index
mean rate
decoder (given target)
C
Signals aligned to peak acceleration (63 conditions)
change (baseline SD)
0
−5
−10
−15
field term, pairwise
field term, independent
polarization index
mean rate
−500
−250
0
250
500
750
1000
time from peak acceleration (ms)
D
The dip is polarization, not mean rate
correlation with pairwise field term (per condition)
1.0
0.5
0.0
−0.5
−1.0
field term, independent
polarization index
mean rate
E
Rate pooled over 1,092 cells (95% session bootstrap)
rate change (spikes/s)
0
−5
−10
−15
−500
−250
0
250
500
750
1000
time from peak acceleration (ms)
F
Per session: field term dips, rate does not reliably
change at peak acc. (baseline SD)
0
−10
−20
−30
field term
mean rate
field term, rate regressed out
