
21 sessions x 3 blocks = 63 conditions, 10-ms bins, exclusions applied. Field term = time-varying-field part of the Ising energy, -sum_i h_i(t) s_i; firing rate = population-average spike probability. Rest controls = the same search in windows shifted -1.5/-2/-2.5 s. Statistics are session-level (n = 21) two-sided Wilcoxon tests. EXPLORATORY: computed post hoc from the E09 table, not pre-registered, no FDR correction. Formal test planned as E12.
