
a
Couplings add prediction at every time point (21 sessions)
couplings, simultaneous states
control: states lagged 200 ms
trial-shuffle null
held-out gain over time-varying-rate model (nats/bin; median, IQR)
ms from peak velocity
b
Gain − null, by phase
gain minus shuffle null
base
acc.
dec.
post
late
c
With time-varying fields the energy drop is carried by the field term
ΔE per neuron vs baseline (median, IQR)
coupling term, stationary model
coupling term, time-varying fields
field term, time-varying fields
ms from peak velocity
d
Exact likelihood agrees
(39 conditions, N ≤ 20)
gain, exact likelihood
gain, pseudo-likelihood
